

PgMarket 1.2.x relational database schema

MODULARITY

- In application.inc.php it is chosen which optional tables are used and which optional fields are used (and, if necessary, which of them are mandatory).
- If not specified, when an optional field is used, it has to be considered a mandatory field.
- The scripts are aware of which optional tables and of which optional fields are used.
- The validation function for an optional field must be capable of handling the corresponding use setting; alternatively, it is invoked only if the field is not empty and, if the field is mandatory, its absence must be handled by the calling script.
- The templates are aware of which optional tables are used and of which optional fields are used.

PgMarket 1.4.x relational database schema

MODULARITY

- In application.inc.php it is chosen which optional tables are used and which optional fields are used (and, if necessary, which of them are mandatory).
- If not specified, when an optional field is used, it has to be considered a mandatory field.
- The scripts are aware of which optional tables and of which optional fields are used.
- The validation function for an optional field must be capable of handling the corresponding use setting; alternatively, it is invoked only if the field is not empty and, if the field is mandatory, its absence must be handled by the calling script.
